

**Experience our pure cloud  
environment in as little as 3 minutes**

## **Challenge is our Resolution**

We help organizations that are looking to establish or improve public and private cloud systems. We specialize in server software that dramatically reduces the number of virtual servers and eliminates demand for streaming virtual desktop clients.

If you are already reliant on the cloud, we can help you get the most out of your hardware. Explore new possibilities and consider our innovative approach to the cloud which will dramatically reduce data and CPU consumption.

Aurawin Social Computing Server (SCS) along with the Aurawin Virtual Desktop Machine (VDM) platform provide you with software you need to deploy a pure cloud infrastructure. SCS routes data and executes all back-end code. SCS serves the VDM which establishes a cloud desktop over the web to any HTML5 enabled device. Each registered user can have multiple virtual representations - one for each of their devices. Bring your own device (BYOD) policies are much easier to embrace and maintain as there are no virtual machine images to corrupt by typical virus, malware, or operating system crashes.

## **Simplicity is our Mission**

Our mission is to develop cloud infrastructure software that requires little-to-no administration. Once configured, SCS will monitor back-end code execution, and restart if needed. System administration is so easy it can be done by anyone with basic technical skills.

Rapid application development with Aurawin is easy. We provide tools needed for developers to design and deploy applications. Aurawin platform includes Core Objects, Application, Forms, Database, UI Widgets, and System API. Developers can easily create apps that have the look and feel of traditional desktop software. The majority of development is accomplished with simple CSS and JavaScript. The major benefit is that once an app is installed, all users have access to it.
